                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DNA 8:553-574(1989).

DNA 8:553-574(1989).

THE ENZYME CLEAVES LYSTARG AND ARG-SER BONDS. IT ACTIVATES, IN A RECIPROCAL REACTION, FACTOR XII AFTER ITS BINDING ACTIVATES, IN A RECIPROCAL REACTION, FACTOR XII AFTER ITS BINDING TO A NEGATIVELY CHARGED SURFACE. IT ALSO RELEASES BRADYKININ FROM HAW KININOGEN AND MAY ALSO PLAY A ROLE IN THE RENIN-ANGIOTENSIN SYSTEM BY CONVETTING PRORENIN INTO RENILS.

TSUBUNIT: THE ZYMOGEN IS ACTIVATED BY FACTOR XIIA, WHICH CLEAVES THE MOLECULE INTO A LIGHT CHAIN, WHICH CONTAINS THE ACTIVE SITE, AND A HEAVY CHAIN, WHICH ASSOCIAVES WITH HAW KININOGEN. THESE CHAINS ARE LINKED BY ONE OR MORE DISCIPLED BONDS.

TSUBLILARITY: CONTAINS 4 APPLE DOMAINS.

TRYPSIN FAMILY. PLASMA KALLIKREIN SUBFAMILY SI; ALSO KNOWN AS THE TRYPSIN FAMILY. PLASMA KALLIKREIN SUBFAMILY.

-!- FUNCTION: THE ENZYME CLEAVES LYS-ARG AND ARG-SER BONDS. IT
ACTIVATES, IN A RECIPROCAL REACTION, FACTOR XII AFTER ITS BINDING
TO A NEGATIVELY CHARGED SURFACE. IT ALSO RELEASES BRADYKININ FROM
HWW KININGEN AND MAY ALSO PLAY A ROLE IN THE RENIN-ANGIOTENSIN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SYSTEM BY CONVERTING PRORENIN INTO RENIN.
SUBUNIT: THE ZYMOGEN IS ACTIVATED BY FACTOR XIIA, WHICH CLEAVES
THE MOLECULE INTO A LIGHT CHAIN, WHICH CONTAINS THE ACTIVE SITE,
AND A HEAVY CHAIN, WHICH ASSOCIATES WITH HMW KININGGEN. THESE
CHAINS ARE LINKED BY ONE OF MORE DISOLFIDE BONDS.
SIMILARITY: CONTAINS 4 APPLE DOMAINS.
SIMILARITY: BELONGS TO PEPTIDASE FAMILY S1; ALSO KNOWN AS THE
TRYPSIN FAMILY. PLASMA KALLIKREIN SUBBRAMILY.

MTSP and its corresponding nucleotides are useful in preventing or treating tumours or cancers such as lung carcinoma, colon adenocarcinoma and ovarian carcinoma, in diagnostics and in hybridisation assays. MTSP is useful as a diagnostic marker for tumour development, growth and/or progression and as immunogens to generate antibodies that specifically bind to it. MTSP DNA is useful in a yeast two-hybrid system and in

AAC78458 to AAC78599 represent polypucleotide and EST (expressed sequence tag) sequences which encode secreted or transmembrane PRO polypeptides. The PRO polynucleotides and polypeptides have cytostatic activity. The polynucleotides and polypeptides can be used for detecting the presence of PRO polypeptides in samples, for linking bioactive molecules to cells and for modulating biological activities of cells, using the polypeptides for specific targeting. The polypeptide targeting can be used to kill the target cells, e.g. for the treatment of cancers. The polypeptide pairs provide specific targeting of bioactive molecules to cells. AAC78600 to AAC78987 represent PCR primers and probes used in the isolation of the PRO polynucleotide segments.

                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function: Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. AAZ33891 to AAZ43438, and AAX41685 to AAX41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present

                                                                                                                                                                                                                                                                                                                                                                        This invention relates to a novel transmembrane serine protease called tumour associated differentially-expressed gene 12 (TADG-12). TADG-12 is located on chromosome 17. Sequences haha93842-A93845 and AAB32246-B32249 represent human TADG-12 (TADG-12)) leads to a truncated protein sequences. A splice variant of TADG-12 (TADG-12) leads to a truncated protein product. TADG-12 is overexpressed in ovarian carcinomas. TADG-12 exhibits cytostatic activity, and can be used in vaccines and in gene therapy. TADG-12 nucleotide and protein sequences are used in the diagnosis of malignant hyperplasia and cancers or the ovary, breast, lung, colon, prostate and other cancers where TADG-12 is overexpressed. TADG-12 1s particularly used as tumour marker for early disease diagnosis. TADG-12 proteins or fragments can be used to vaccinate an individual with cancer, suspected of having a cancer or at risk of getting cancer. Sequences AAA93846-A93853 represent PCR primers used for amplifying the TADG-12 cDNA sequence, and in the quantitative analysis of TADG-12 mRNA, AAB32250 represents a peptide fragment of TADG-12, used to create anti-TADG-12 antibodies. Sequences AAB32251-B32369 represent for fargments contained to the contained that the contained

Serine protease nucleic acids are also useful in gene therapy. Note: The present sequence shown in page 280-281 of sequence listing has been assigned SEQ ID NO: 14. But the sequence, human serine protease epidermal growth factor (EGF)-like domain (AAY/21:14) shown in page 12 is also referred as SEQ ID NO: 14.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          proliferative and cancerous conditions (acute myelogenous leukaemia), allergic reactions (asthma), cardiovascular disorders (arrhythmia), occular disorders (glaucoma) and infectious diseases caused by bacteria, viruses, fungi or parasites. It is also useful for screening therapeutic compounds. Serine proteases are used as immunological probes or polymorphic markers for the identification of chromosomes, cells and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           autoimmune disorders (systemic lupus erythematosus), wound healing, reproductive system disorders (testicular cancer), digestion and for absorption disorders (crohn's disease), neurodegenerative diseases (Alzheimer's disease), behavioral disorders (Tourette's syndrome),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to human serine proteases and their cDNA clones. It is used in methods for the diagnosis, prevention and treatment of various disorders related to serine protease such as bone formation disorders (osteoporosis), connective tissue disorders (arthritis),
                                                                                                                                                 Tumour associated differentially-expressed

                                                                                                                                                                                                                                                                                                                                                                                                        Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC This invention relates to a novel transmembrane serine protease called CC tumour associated differentially-expressed gene 12 (TADG-12). TADG-12 is clocated on chromosome 17. Sequences AAA93842-A93845 and AAB32246-B32249 CC located on chromosome 17. Sequences AAA93842-A93845 and AAB32246-B32249 CC represent human TADG-12 (TADG-12V) leads to a truncated protein sequences. CC A splice variant of TADG-12 (TADG-12V) leads to a truncated protein CC product. TADG-12 is overexpressed in ovarian carcinomas. TADG-12 (CAXIADITES CONTROLLAR) and protein sequences are used in the CC diagnosis of malignant hyperplasia and cancers or the ovary, breast. CC lung, colon, prostate and other cancers where TADG-12 is overexpressed. CC TADG-12 is particularly used as tumour marker for early disease CC diagnosis. TADG12 proteins or fragments can be used to vaccinate an CC individual with cancer, suspected of having a cancer or at risk of CC getting cancer. Sequences AAA93846-A93853 represent PCR primers used for 2 amplifyIng the TADG-12 CDNA sequence, and in the quantitative analysis of CC TADG-13 marka. AAB3250 represents a peptide fragment of TADG-12, used to CC TADG-13 peptides which target HLA, and may be used in a vaccine or for immune stimulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

AAC77607 to AAC78448 encode the human cancer associated proteins given CC in AAB4398 to AAB44239. The proteins can have activities based on the ctissues and cells the genes are expressed in. Example of activities include: cytostatic; proliferative; vulnerary; immunomodulator; antidiabetic; antiasthmatic; antirheumatic; antiarthritic; antiviral; contininfammatory; antithyroid; antiallargic; antibacterial; antiviral; comparison contrological; neuroprotective; cardiant; thrombolytic; coaquiant; contrologic; vasotropic; antipsoriatic and antiangiogenic. The polynucleotides and polypeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions. CC polynucleotides, polypeptides, antibodies, agonists and antagonists from the present invention may be used to treat immune disorders by activating confiniting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoietic cells, autoiamnune cells, nodulate haemostatic or thrombolytic activity, modulate
                                                          inflammation, cancers, cardiovascular disorders, neurological disease and bacterial or viral infections. The peptides, nucleotides, antibodies, agonists and antagonists may be also be used in drug screens. AAC78449 to AAC78457 and AAB44240 represent sequences used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               antiinflammatory; antithyroid; antiallergic; antibacterial; cardiant; dermatological; neuroprotective; thrombolyttlo; coagulant; nootropic; vasotropic; antipsoriatic; antiangiogenic; gene therapy; inflammation; immune disorder; haematopoietic cell disorder; autoimmune disorder; allergic reaction; graft versus host disease; organ rejection;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 뮹
                                                                       expression. For example, N and P may be used to treat discorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps. By inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent sequences used in the exemplification of the
                                                                                                                                                                                             cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P

                                   This protein is encoded by a gene which is androgen (e.g. testosterone) inducible in androgen-dependent prostate cancer cells (e.g. LNCaP cells) and constitutively expressed in androgen-independent prostate cancer cells (e.g. LN INCaP cells). Agents which decrease the expression or activity of these clones may slow or arrest the growth of prostate cancer cells or may kill them. HrPCa6/7 can be obtained from the sequence of the known gene for TMPRSS2. A compound useful for treating prostate cancer can be identified in a novel method comprising measuring the expression level, or activity, of HRPCa2, 3, 6/7, 8, 9, 10, 13, 14, 15, 19, or peripheral-type benzodiatepine receptor (PBR) in a cell, in the presence and absence of a test compound. The sequences may also be used in diagnosis of prostate cancer and to determine efficacy of treatment
                                                                                                                                                                                                                                       Novel methods for identifying compounds for a comprising measuring the level of expression of 11 genes or their products
                                                                                                                                                                                                                 Claim

(I) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (I), (II), antibodies to (II), fusion proteins comprising (II), and isolated T cells prepared using (I) or (II) are used treat cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. The cancer that is diagnosed or treated is particularly prostate cancer. (I) and (II) can be used in vaccines. The antibodies of (I) can be used for monitoring the progression of cancer in a patient. (I) and (II) can also be used to improve diagnostic and therapeutic methods for prostate volume. AAH93357 to AAH93944 and AAM01115 to AAM01318 represent polynucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                         12-MAY-2000

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention provides a new tumour suppressor gene, designated TMPRSS2. The TMPRSS2 polynucleotides and polypeptides can be used in methods for diagnosing and prognosing predisposition to cancer in humans. The polypeptides may also be used in assays to screen for compounds with anti-cancer or therapeutic properties. The polypeptides are also useful for rational drug design. The TMPRSS2 polynucleotides and polypeptides may be used for gene therapy and protein therapy. The present sequence represents the TMPRSS2 polypeptide.
                                                                                                                                                                                                                                                                                                                                                             AAY44406 standard; Protein; 492

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    protein) which is a prostate-specific, androgen-regulated, cell surface serine protease. It is a glycosylated type II transmembrane protein with an extracellular C-terminal serine protease domain, a scavenger receptor cysteine-rich domain, an LDL receptor class A domain and a predicted transmembrane domain. Host cells can be transformed to produce this protein, using vector containing 20PIF12/TMMPRSS2 gene (also designated 20PIF12-GTC1, as deposited with ATCC accession number 207097). Anti-20PIF12/TMMPRSS2 antibodies may be used as therapeutic agent for prostate and colon cancers, to image prostate cancer cells and prostate tumours, to identify ligands and cellular constituents that bind to a 20PIF12/TMMPRSS2 gene product and for use as cancer vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      01-JUN-1998;

(I) and (II) have cytostatic activity and can be used in vaccine production and gene therapy. (I), (II), antibodies to (II), fusion proteins comprising (II), and isolated T cells prepared using (I) or (II) are used treat cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. The cancer that is diagnosed or treated is particularly prostate cancer. (I) and (II) can be used in vaccines. The antibodies is prostate cancer. (I) and (II) can be used in vaccines in a patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes polynucleotide sequences (I) which encode prostate-specific proteins (II). (I) and (II) have cytostatic activity,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          diagnosing, monitoring and for use in vaccines -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New polynucleotide encoding a prostate-specific protein, diagnosing, monitoring and treating prostate cancer in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Xu J,

                                                                                                                                                     The present invention relates to prostate specific androgen regulated proteins. The invention may be used to determine an expression level of the prostate-specific proteins ARSDRJ, TWPRSZ2, or PART-1 in a fluid sample or prostate cell sample from an individual. It may also be used for diagnosing and predicting the susceptibility of a prostate neoplastic condition in an individual. Inhibitors of the proteins are useful for treating or preventing the progression of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polynucleotide encoding prostate specific androgen regulated polypeptides and inhibitor of the peptides useful for treating reducing the progression of prostate neoplastic condition in individual -

AAY57280 standard;
The invention relates to detecting, diagnosing metastasis and staging cancer by measuring levels of cancer specific genes (CSG) in cells, tissues or body fluids. Their remission and progression, decreases and increases in CSG levels, is also monitored, by periodic sample analysis. The methods are useful for detecting cancers, especially gynecologic cancers which include ovarian, breast, endometrial and uterine cancer and lung cancer. Antibodies against the CSGs labeled with paramagnetic ions or a radioisotope is useful for imaging cancer and when conjugated
                                                                                                                                              Diagnosing, staging, monitoring, imaging and treating cancer especially gynecological cancers e.g. breast, ovarian cancer and lung cancer, involves measuring cancer specific gene levels in cells and body fluids
